

Abstract:

The invention relates to a method for the transmission of a location-based message (6). In the method at least one recipient (2) is determined for the message, and the message is transmitted from a sender's (1) wireless communication device (3) to a wireless communication device (3') of one or more said recipients (2). The method comprises at least the following steps:

- a positioning step for positioning the sender's wireless communication device (3),
- a range definition step for defining the message transmission range,
- a detection step for detecting whether the recipient of the message is located within the message transmission range, and
- a presentation step, wherein the message is presented in the recipient's wireless communication device (3'), in case said recipient of the message is located within the message transmission range.
